

Hi, my name is Michael Molter. I am currently a student at UCLA majoring in Electrical Engineering. I was born in a town just outside of Dallas, Texas. Shortly after I was born, I moved to Austin, Texas where I grew up and attended Westlake High School.

In high school, I participated in the school's robotics team. Most of my exposure to the engineering discipline comes from my time in robotics. Doing robotics, I was able to learn about design and the design process. I was also able to do a lot of problem solving which is something I really enjoy doing and is part of the reason I enjoy engineering so much.

I choose electrical engineering because it is a very broad field that works in many industries. I thought being able to pick a certain industry and subfield of electrical engineering you could work is a really nice perk of being an Electrical engineer. I also enjoy working with hardware and software, and Electrical engineers are able to work in both. Throughout school, I also enjoyed physics and math a lot and electrical engineering incorporates the practical parts of both. As well, I have always found electronics and messing around with circuits fascinating and fun, so electrical engineering seemed like the natural choice.
