Internship and FTE opportunities

Twitter is looking for MSc and Ph.D. interns for the summer of 2021 and is also looking for new grad full-time hire.

Short introduction to our teams:

Who We Are: Twitter's Discovery teams are dedicated to getting the majority of the world to find and participate in all that is happening on Twitter. We are composed of many teams across the company, including Product, Engineering, Design, and Data Science. We are in charge of features like new user sign up flow & education, personalized recommended notifications, re-activating returning users, and much more.

The charter of the whole Discovery team involves work in areas such as machine learning, applied data science, recommendation systems, distributed systems, and information retrieval systems, all applied at a large scale. However, to realize those gains, it's critical for our product engineers to utilize those platforms and systems, build out user facing features and test it out using online experimentation. Discovery has been a major contributor to Twitter's growth and continues to expand its impact on users through the great collaboration between our ML engineers, infrastructure engineers and product engineers.

The areas we are interested in are quite diverse We have opportunities across general infra, and backend software engineering to applied ML.

For ML roles, we look for good ML foundations, and experience with deep learning would be a plus. For backend software engineering roles, we look for just general CS foundations, and internships in relevant consumer companies is a plus. For infra positions, a good understanding of distributed systems is a plus.

If interested, please apply using the link below.
